

11/14/14 - CYPRUS: New Da Vinci system for Robotic Surgery available for patients [Financial Mirror (Cyprus)]

The medical team at the Centre for Robotic Surgery of Hippocrateon Private Hospital records impressive results for patients in Cyprus.

A pioneer since 2008, the Centre for Robotic Surgery created a tradition in performing specialised surgical operations using the Da Vinci robotic system.

Being the first to follow the developments, it recently acquired the latest, State- of-the-Art Da Vinci model, which is equipped with the most advanced robotic technology and is described as the top of medical science.

This ultramodern medical device is a jewel for medicine, making the Centre the main player in the medical times of Cyprus.

In the last six years, the experienced team of the Centre for Robotic Surgery performed more than 600 high precision surgical operations with excellent results, on patients with urological diseases.

Since 2012, this revolutionary method has been applied in gynaecology, having successfully treated more than 150 gynaecological medical incidents, providing huge benefits, maximum safety and a perfect aesthetic result to female patients.

Exploiting its long experience and specialised knowledge in the field of robotic technology, the Hippocrateon Hospital has in the last year, been performing robotic surgeries covering the whole spectrum of general surgery.

The new, innovative Da Vinci Robotic Surgery System provides the following:

- A 3-D High Definition system of the field of operation
- The Possibility to integrate a double surgical console
- Upgraded surgical benefits for the surgeon

- The possibility of imaging blood vessels by using the inter-operative imaging system (Firefly Fluorescence Technology system) by indocyanine injection
- The possibility to use advanced robotic instruments, guided by the console surgeon such as the vessel sealer for the ligation of vessels of a diameter up to 7 mm and the Stapler
- The possibility to integrate robotic surgical instruments to perform surgical operations through a SINGLE hole of a diameter of 1,8 cm through the patient's navel
- The possibility of a simultaneous imaging of additional medical images and examinations in the surgical console in real time (Tile Pro)

Robotic surgery has already been used in Cyprus for 6 years.

18.11.2014

Being the top of medical science, the da Vinci Robotic Surgical System is able to achieve excellent results for patients and provides huge benefits for the surgeon. Located in the capital of Cyprus, the Centre for Robotic Surgery has been using this modern medical device since 2008. During the last six years, the highly experienced robotic surgery team at Hippocrateon Private Hospital has successfully been applying this robotic technology first in urology and from 2012, in gynaecology. A total of more than 750 high precision surgical operations were performed at the Centre over that six-year period. The good news is that this Nicosia`s Centre for Robotic Surgery has recently acquired the latest model of the da Vinci Surgical System. This new version, which some professionals refer to as a jewel for medicine, makes the local Centre a world-class medical player. Equipped with 3D high-definition vision system and tiny instruments, it provides the possibility to perform operations through very small incisions (they can be as tiny as just 1.8 cm in diameter through the patient`s navel). Expanding capabilities of the surgeon, the System offers minimally invasive option for surgery. Guided by the surgeon from a control console, robotic system translates movements of the surgeon`s hand into movements of the robot`s arms. The latest model of da Vinci Surgical System allows for the integration of double surgical console. A wide range of very advanced robotic instruments enable the surgeon to perform operations with high precision and control. A vessel-sealing device, for example, can be used for the ligation of tiny vessels of a diameter up to 7 mm. The

imaging capability of the latest model of da Vinci has been enhanced with the inter-operative imaging system-the Firefly Fluorescence Technology system. This system gives the surgeon additional visual information that helps him to get more detailed image of the surgical field. Last year, the Hippocrateon Hospital used this innovative robotic technology for performing operations, which covered a whole range of general surgery, and recorded perfect results for patients.
